

1. What is HTML & Its Importance (فائدتها):

- HTML stands for HyperText Markup Language.
- It is the backbone/skeleton of any website on the internet.
- Purpose: It structures the web content, defining elements like headings, paragraphs, images, links, and forms.
- Without HTML, web browsers wouldn't know how to display texts or organize layout structures.

2. Most Important Concepts in HTML (أهم الحاجات في اللغة):

- Semantic HTML: Using tags that describe their meaning (e.g., <header>, <article>, <footer>) instead of just using <div>. This is crucial for SEO and accessibility (Accessibility).
- Document Structure: Every HTML file must have a proper standard structure starting with <!DOCTYPE html>, followed by <html>, <head> (for metadata), and <body> (for visible content).
- Attributes: Providing extra information about elements (like 'href' for links and 'src' for images).
- Clean Code & Nesting: Closing tags properly and keeping code readable for teamwork.

3. Most Commonly Used Tags (استخداماً أشهر الـ Tags):

* Structure Tags:

- <html> : The root element of the HTML page.
- <head> : Contains meta-information, page title, and links to CSS.
- <body> : Contains all the visible content on the webpage.

* Layout (Semantic) Tags:

- <header>, <nav>, <main>, <section>, <article>, <footer> : Used to divide the webpage professionally and improve SEO.

- <div> : A generic container used for styling and layout grouping.

* Content Tags:

- <h1> to <h6> : Headings (h 1 is the most important).

- <p> : Paragraphs for text content.

- <a> : Anchor tag, used to create hyperlinks (requires 'href' attribute).

- : Used to embed images (requires 'src' and 'alt' attributes).

* Lists & Tables:

- & : Unordered (bulleted) lists.

- & : Ordered (numbered)
